

Executive Summary Report

Superstore Sales Performance Dashboard

1. Project Overview

This project involved designing an interactive executive dashboard for a national retail company using the Superstore Sales dataset. The goal was to give management clear visibility into sales performance, profitability, customer behaviour, and regional results so they can make better data-driven decisions.

Dataset used: [Superstore Dataset \(Final\)](#)

The dataset covers sales transactions across the United States from 2014 to 2017 and contains information on orders, customers, products, regions, sales, and profit.

2. Key Findings

\$2.30M Total Sales	\$286,400 Total Profit	12.47% Profit Margin	5,009 Total Orders
-------------------------------	----------------------------------	--------------------------------	------------------------------

Main insights from the dashboard:

- **The West Region** leads in both sales and profit.
- **Technology** is the most profitable product category, while **Furniture** has weak profitability.
- **The Consumer segment** generates the highest revenue.
- **Sales show a clear seasonal pattern**, rising strongly in the last quarter of the year.
- **Profit is concentrated** in a small number of top-performing products.

3. Business Risks

- Heavy dependence on the West Region.
- Weak profitability in the Furniture category.
- Over-reliance on a few high-profit products.

4. Recommendations

1. **Strengthen sales and marketing efforts** in the Central and South regions.
2. **Review and improve (or reduce)** low-profit Furniture products.
3. **Increase focus** on high-margin Technology products.
4. **Protect and promote** the top profitable products.
5. **Align inventory and marketing activities** with seasonal sales peaks.
6. **Apply stricter control on discounts**, especially for low-margin items.

5. Conclusion

The dashboard provides a clear and interactive view of business performance. By acting on the insights above — especially improving weaker regions, fixing low-profit products, and focusing on high-margin categories — the company can improve overall profitability and reduce key business risks.
